

YoNihon - Additional Workshop & Booking Requirements

Partner Dashboard

Partners should be able to manage their workshop availability directly from their dashboard using a simple calendar interface. With just a few clicks, they should be able to mark specific dates and time slots as available or unavailable, making it quick and easy to keep their workshop schedule up to date without needing any technical knowledge.

Workshop Booking Flow

When customers make a reservation, they should be able to select a preferred (primary) date and time, as well as one or more alternative (secondary) dates and time slots. If the workshop is unavailable at their primary choice, the workshop partner can easily confirm one of the alternative options without having to contact the customer to find another suitable time. This will make the booking process faster, reduce unnecessary back-and-forth communication, and increase the chances of successfully confirming reservations.

Booking Approval Workflow

When a customer submits a reservation request, it should not be confirmed automatically. Instead, the booking request should be sent to the workshop owner, who can review it and either accept or reject the reservation. If the requested date or time is unavailable, the owner should have the option to suggest alternative available dates and time slots. The customer can then choose one of the suggested options and confirm the booking. This keeps the booking process flexible while ensuring workshop owners have full control over their schedule.

Messaging System

Workshop owners and customers should have access to a secure in-platform messaging system once a reservation has been submitted. This messaging feature should allow both parties to communicate directly regarding their booking without relying on phone calls or emails. They should be able to discuss booking details, ask questions before the workshop, request to reschedule, notify each other if they are running late or unable to attend, arrange special requirements, or communicate any other workshop-related information. All conversations should remain linked to the specific booking so that both parties can easily view the communication history. Phone calls or email should only be used as a secondary method of contact if one party does not respond through the messaging system within a reasonable period. This feature will provide faster communication, improve the overall customer experience, reduce unnecessary emails and phone calls, and make booking management more convenient for both workshop owners and customers.

Reservation Number

Each reservation should be assigned a unique Reservation Number automatically at the time the booking request is created. This Reservation Number should be displayed in the customer's booking confirmation, customer dashboard, workshop owner's dashboard, and admin dashboard. Upon the customer's arrival, the workshop owner can quickly search for or verify the reservation using the Reservation Number, together with the customer's name and booking details. This will make the check-in process faster, reduce the possibility of errors, simplify reservation management, and provide an easy reference for all future communication, booking updates, cancellations, and customer support.

Digital Reservation Ticket

Each reservation should be assigned a unique Reservation Number automatically when the booking request is created. This Reservation Number should be displayed in the customer's booking confirmation, customer dashboard, workshop owner's dashboard, and admin dashboard. Upon the customer's arrival, the workshop owner can quickly search for and verify the reservation using the Reservation Number together with the customer's name and booking details. This will simplify the check-in process, reduce the possibility of errors, and provide a consistent reference for all future communication, booking updates, cancellations, and customer support.

In addition, once a reservation has been confirmed, the system should automatically generate a digital reservation ticket. The ticket should contain all essential booking information, such as the Reservation Number, workshop name, customer name, date and time, number of participants, workshop location, meeting instructions, and any other important details. Customers should be able to view this ticket at any time from their dashboard and present it upon arrival instead of searching through emails. If possible, the ticket should also support adding it directly to Apple Wallet (iPhone) and Google Wallet (Android), allowing customers to store and access their reservation quickly and conveniently from their mobile device. This will provide a smoother check-in experience for both customers and workshop owners while reducing confusion and making reservations easier to manage.
