

Additional Requirements to Add to Partner Workshop Management & Booking Workflow (v2.2)

21. Two-Way Reservation Messaging & Email Synchronization

Whenever a workshop owner or customer sends a message through the reservation messaging system, the recipient should automatically receive an email notification linked to the reservation. The email should include the message or a preview. If the recipient replies directly to the email, the reply should automatically synchronize back into the same YoNihon reservation conversation. All messages, regardless of whether they originate from YoNihon or email, must remain in a single reservation thread visible to both customer and workshop owner. This reduces missed messages, improves response times, and provides seamless communication.

22. Booking Amendment / Reschedule Workflow

Customers should be able to request a booking amendment (date and/or time change). The request must require workshop owner approval, similar to a new booking request. The system should clearly display the original reservation details alongside the requested new date and time. Booking status should temporarily become 'Amendment Requested' or 'Awaiting Approval'. Once approved, the booking should update automatically while preserving an audit history.

23. Booking Change Indicators

Workshop owner dashboards should clearly highlight booking types using badges such as NEW, AMENDED, RESCHEDULED, CANCELLED, and PENDING so important changes can be identified immediately without opening each reservation.

24. Booking History

Every booking should retain a complete history of all amendments, approvals, cancellations, and reschedules including timestamps and the user who performed each action.

Recommended Improvements

Replace partner-controlled review approval with admin moderation only. Expand booking statuses to Requested, Pending Partner Review, Alternative Suggested, Awaiting Customer, Confirmed, Checked In, Completed, Cancelled by Customer, Cancelled by Partner, Expired, No Show, Amendment Requested, and Rescheduled. Build a full Software Requirements Specification (SRS) including user journeys, permissions, validation rules, APIs, database schema, error handling, scalability, and security.
